Intro

Why this exercise. We're assessing senior judgment, not metric plumbing: how you frame an ambiguous problem, decide what matters, defend a position to people who'll push back, and recognise the limits of your own analysis. There is no single right answer and no hidden trick.

A few promises from us. We'll tell you exactly how we evaluate this (below). The work is capped at **~3 hours and we mean it** — over-investing is not rewarded and we'd rather see a sharp, partial answer than an exhausted one. Your submission is reviewed against a fixed rubric by two people. If a timed take-home doesn't fit your circumstances (caregiving, current role, anything else), tell us — we'll substitute a portfolio walkthrough plus an extended live working session, no penalty. You're welcome to use whatever tools you normally use, AI included; the only rule is that you can explain and defend every choice.

Context

Shine has different products, but in this case study we focus on Shine Banking (hereafter "Shine"). Shine is a neobank for French freelancers and small businesses, now expanding upmarket into larger SMBs. Leadership believes revenue growth is healthy but has no shared view of *where* revenue comes

from, where it's at risk, and what to do next. You've been handed the raw data and a seat at the table.

You'll work with two tables (schema and access below): one row per company (signup, KYB validation, activation, closure dates, initial plan, persona) and one row per company per month of revenue, split into subscription, interchange, banking fees, and deposit interest.

Some things are deliberately left to you. We have **not** defined "churn," "active customer," or "a healthy account" — choosing definitions that fit a bank like Shine, and saying why, is part of the exercise. The data is real-world: broadly sound, but don't assume it has been cleaned or shaped for you.

Your mandate

Brief a leadership audience (CEO, CFO, Head of Growth) on one question:

Where is the biggest revenue risk or opportunity for Shine right now, and what should we do about it?

How you scope it, which metrics you build, and what you leave out are yours to decide and defend. We are deliberately not giving you a KPI list — selecting and justifying the right measures is part of what we judge.

Within that, we want to see you:

- **Take a position.** Recommend your **top one or two** initiatives for next quarter, ranked, and say why they beat the alternatives you considered and rejected. If your honest view is "don't force a single bet, and here's why," that's a legitimate position — defend it. What we don't want is six equally-weighted ideas.
- **Be honest about magnitude and its limits.** Show how big each opportunity or risk is *relative to the others*, and be explicit about what this dataset does **not** contain that you'd need to size it properly in euros. Knowing what you can't yet conclude is part of the score.
- **State your definitions and assumptions** out loud, especially where the data forced a judgment call.
- **Prove it, don't just assert it.** For your lead recommendation, how would you *test* that the lever actually works — what experiment or measurement would you set up, and what would success look like? Separate what the data shows (association) from what you'd need to establish cause.

- **Flag what you'd validate first.** Before leadership acts, what two or three things about the data or your assumptions would you check? This is a bank — call out anything touching data quality, privacy, or how KYB data should and shouldn't be used.
- **Show the engine.** Provide the SQL behind your key numbers and a short written note on how you'd productionise this so the metrics are trusted and repeatable: modelling approach, what you'd test, who owns it. No repo needed.

What we're evaluating

Roughly in priority order: (1) problem framing & prioritisation; (2) analytical rigour & honesty about limits; (3) business judgment; (4) communication & stakeholder handling; (5) technical craft. Within that, we care a lot about **which KPIs you choose and how you define them** as well as **how you visualise your findings** and **how you interpret revenue**: what's driving it, what's fragile about it, and what you'd do next. We're not scoring exhaustiveness or design polish for its own sake, a sharp three-slide argument, backed by the right KPIs, and a clear read on revenue, beats a fifteen-slide tour or a wall of prose with no visual evidence.

Logistics

- **Format:** a short deck or written memo, plus your SQL — whatever makes the argument land.
- **Take-home time:** cap at **~3 hours**. If you run out, tell us what you'd do next and why — that's a signal in itself.
- **Live discussion:** a 60-minute session — you'll present your analysis for 15–20 minutes, then we discuss and pressure-test the thinking together. The take-home is short on purpose because this conversation is where it counts.
- **Data access / submission / turnaround:** Questions to saghar.akhtar@shine.fr.
